Backend Engineer with 2+ years of experience building scalable APIs, real-time systems, and cloud-native applications. Skilled in Node.js, Python, FastAPI, PostgreSQL, Redis, Docker, AWS, and AI-powered applications using OpenAI APIs and RAG architectures.

Experience

FoodHung | Backend Engineer Aug 2025 – May 2026

- Architected and scaled backend services supporting 10,000+ users and handling 200-400 requests/sec across critical business workflows.
- Designed high-performance APIs and distributed backend components using FastAPI, PostgreSQL, Redis, and Docker, focusing on scalability, reliability, and low-latency data access.
- Improved application performance by 30%+ through query optimization, indexing strategies, caching layers, and efficient database design.
- Integrated AI-powered capabilities using OpenAI APIs, enabling intelligent automation, semantic search, and enhanced user experiences.
- Led cloud infrastructure operations on AWS, implementing CI/CD pipelines, monitoring, deployment automation, and production reliability practices achieving 99.5% uptime.
- Collaborated across product and engineering teams to design scalable architectures, troubleshoot production incidents, and drive continuous platform improvements.

World Social Integration | Software Developer Jun 2024 – Jul 2025

- Engineered backend systems and real-time communication services supporting 15,000+ concurrent users using Node.js, PHP, MySQL, and WebSockets.
- Designed and maintained production-grade REST APIs, event-driven workflows, and high-availability backend services.
- Optimized database performance, API throughput, and application reliability for large-scale user interactions.
- Managed AWS-hosted infrastructure, deployments, monitoring, and operational maintenance of production environments.
- Contributed to system architecture decisions, feature development, debugging, and performance optimization across multiple applications.

Projects

AI Research & Knowledge Platform | FastAPI, OpenAI, Qdrant, PostgreSQL, Redis, Docker

- Built an enterprise-grade RAG platform capable of indexing and querying thousands of documents using semantic search and vector embeddings.
- Designed a hybrid retrieval architecture combining vector search, metadata filtering, and keyword ranking to improve answer accuracy.
- Implemented document ingestion pipelines supporting PDFs, DOCX, and web content with automated chunking, embeddings generation, and citation-aware responses.
- Developed conversational memory, role-based access control, organization-level data isolation, and usage analytics.
- Containerized and deployed services using Docker, Redis, PostgreSQL, and AWS infrastructure.

Distributed Job Processing & Workflow Engine | FastAPI, PostgreSQL, Redis, Docker

- Designed a distributed task-execution platform inspired by Celery and Temporal capable of executing asynchronous workflows across multiple worker nodes.
- Implemented priority queues, scheduled jobs, retries, dead-letter queues, workflow orchestration, and failure recovery mechanisms.
- Built a real-time monitoring dashboard providing execution metrics, worker health status, and task lifecycle tracking.
- Leveraged Redis and PostgreSQL for durable task persistence, event coordination, and horizontal scalability.
- Engineered the platform to process high volumes of concurrent background tasks with fault-tolerant execution.

Distributed File Storage Service (PiCloud) | Node.js, MongoDB, AWS

- Developed a cloud-storage platform supporting chunked uploads, resumable transfers, secure file sharing, and large-file streaming.
- Implemented file versioning, signed URLs, access-control policies, rate limiting, and audit logging.
- Built HTTP range-based streaming and optimized metadata indexing for efficient retrieval of large files.
- Designed storage analytics, monitoring systems, and scalable file-management APIs.
- Integrated AWS services to support reliable and secure cloud-based storage operations.

Technical Skills

- **Languages:** Python, TypeScript, JavaScript, Embedded C
- **Backend:** FastAPI, Node.js, Express.js, SQLAlchemy, REST APIs, WebSockets
- **Databases:** PostgreSQL, Redis, MySQL, MongoDB
- **AI:** OpenAI API, RAG, Qdrant
- **Cloud & DevOps:** Docker, AWS, Linux, Nginx, GitHub Actions, CI/CD
- **Concepts:** System Design, Authentication, Caching, Rate Limiting
- **Tools:** Git, Github, Postman

Education

Govt. Degree College Baramulla (Autonomous)

Bachelor of Computer Applications (BCA)

2023–2026

Achievements

International ATAL Innovation Mission Finalist (NITI Aayog), 2022

- Selected by the Atal Innovation Mission (NITI Aayog) to represent the Union Territory of Jammu & Kashmir at the International ATAL Innovation Exhibition in Bangalore.
- Designed and developed **Blind Curve Safety Mechanism**, an IoT-based road safety solution using microcontrollers, sensors, and Embedded C to help prevent accidents on low-visibility road curves.
- Presented the project alongside student innovators, research institutions, startups, and technology organizations from India and multiple countries.
